

IN THE SPECIFICATION:

Penultimate paragraph page 3, (amended)

All of the above disclosed embodiments apply spring bias between the platform and the base away from the pivotal connecting means between the platform and the base.

All of the figures show a first end of the spring means connected to one of the platform or the base and the second end of the spring means connected to the other of the platform or the base, with the distance between the base connection and the platform connection being greater than the distance between the base and the platform at their closest point.

They provide sufficient movement to enable the platform to be forced forward far enough that the belt may be replaced without disconnection or readjustment.
